Predoctoral Investigator (application for a predoctoral fellowship-Fundación Ramón Areces)

Mechanisms of Tumorigenesis in *Drosophila*

Project Description:
The main focus of our research is the study of tumorigenesis, a phenomenon of great scientific and societal relevance. Because of its sophisticated genetic technology and other experimental advantages, we are using the imaginal discs of the fruitfly *Drosophila melanogaster* as a model system to investigate molecular and genetic factors behind the appearance and development of tumors. We are focusing on the formation of cells with DNA lesions that cannot execute the apoptotic program and become senescent.

Duration:
4 years
